Bitsy Expander RP2040 Pin Map

Standard Use Pinout Diagram

Notes:

- (1) In overlapping (shingled) headers, the inner pins are marked grey since they also serve as primary pins in the header above. Using a pin in one header renders it useless in the other.
- (2) Pins marked with a \sim in this diagram may be used without restrictions to generate PWM signals. The \sim is not part of the pin name and must be omitted in code.
- (3) A separate pin-out diagram is available for use with Arduino IDE.

IMPORTANT: The PWM pin markings (~) on the board included in your kit may differ from those in this diagram. In case of discrepancy, refer to this diagram, as it is more up-to-date. If additional PWM pins are needed, please consult the "PWM Slices and Channels" diagram.
